

# FRONT-END ASSESSMENT

2026

## Idea

We would like you to work on the front-end of a **Museum Activity Calendar**. We're building a page where museum visitors can browse upcoming activities — guided tours, workshops, lectures, children's programs — and reserve a spot.

We're asking you to spend around **2 hours** on this assignment, on site at our office. We know, when it comes to front-end development, stuff is never finished or perfect. That's fine — we're interested in how you work just as much as what you deliver.

Please don't feel like you failed the assignment if you couldn't finish everything in this time. Besides the end product, we're also very much interested in your process. Feel free to think out loud and explain your choices as you go.

## What you get

- A JSON file with activity data (**activities.json**)
- This briefing document
- A wireframe showing the intended structure and functionality

## Wireframe

Please have a look at the enclosed wireframe to get an idea of what we would like to see. The wireframe shows **three states**: the activity overview, the booking modal, and the confirmation.

Please keep in mind that the actual layout of this wireframe is in no way meant to dictate what your product should look like in the end. The wireframe is solely here to show what functionality and structure we would like to see.

The thing is, we would really love to see your take on things and what layout you think is best. So yes, you can change things up, and if you're up for it, don't hesitate to get creative with it and add your CSS fun, sprinkles, transitions, animations, etc.

## Todos

In drawing up this proposal, we have assumed the following principles:

- Display the activities from the JSON feed, grouped by date.
- Each activity shows its type, time, title, description, location, and available spots.
- When a visitor clicks "Reserveer", a booking flow is presented — collecting at minimum a name, email address, and number of spots.
- After booking, available spots are updated in the interface. The visitor sees a confirmation.
- Sold-out activities are visually distinct and cannot be booked.

## Technologies

Your final product should be built with:

- **Next.js** — set up a fresh project yourself using **create-next-app**. How you configure it is up to you.
- **TypeScript or JavaScript** — your choice.
- **CSS Modules** — this is our preferred approach. Plain CSS or SCSS are also fine. Please avoid full layout libraries like Bootstrap.

## Use of AI tools

You are welcome — and encouraged — to use AI tools during this assessment. Claude, Copilot, Cursor — whatever helps you work effectively.

We're not testing whether you can or can't use AI. We're interested in **how** you use it: do you prompt with intent, do you review what comes back, and do you know when to override it? Feel free to walk us through your thinking as you go.

## What we look at

We'll be paying attention to the following — roughly in order of importance:

- **Your process** — how do you approach the problem? What questions do you ask before you start? Do you think before you type?
- **Code quality** — is your HTML semantic? Is your CSS maintainable? Is there unnecessary clutter?
- **Working software** — does the core flow work? A polished half is worth more than a broken whole.
- **Design sensibility** — we're not looking for pixel-perfection, but we do appreciate a sense of craft: spacing, hierarchy, consistency.

- **AI fluency** — how effectively do you leverage AI without losing your own judgment?

Good luck and have fun!

Norday
